

Fractional Corner Radius End Mills by ULTRATOOL

The Ultra-Tool® Series 330R, 362R, and 320R are tough workhorses with Radii that can handle the vast majority of demanding applications. These tools are precision ground from Ultra-Grain®, a premium carbide substrate that couples high hardness with excellent chipping resistance. Choose from 8 different standard radii for your roughing or finishing requirements. Crank up the feed rates even more by adding one of our in-house SmoothCoat® PVD hardcoatings, and / or add SmoothEdge® to eliminate tool break-in. Note the new LOC's and OAL's on the 320R Series!

Components of Guaranteed Quality

COMPONENT#1: Carbide Substrate From being the first Company to introduce MicroGrain carbide to the mass-market round tool industry through the present day, Tool Alliance® has consistently innovated new powder and grade combinations for demanding applications. We recognize that our material is the very first Significant Characteristic. By creating partnerships with a limited number of tungsten powder and cemented-carbide material suppliers, we are able to guarantee that our customers receive precision-tolerance tools ground from only the purest, finest grades available worldwide. The following photographs of Ultra-Carb® 1 and Ultra-Grain® 1 respectively demonstrate the complexity of the compound we commonly refer to as Cemented Carbide. Taken at magnification of 10,000 X through an SEM (Scanning Electron Microscope), the visible grains are tungsten while the cobalt binder appears as dark shadows. The largest tungsten grains appearing in the Ultra-Carb photo are less than one micron in size. Note that these grades are two samples representing more than a dozen different substrates we use throughout our product lines, each having a particular application niche. Compared to other industry participants, you will find that Tool Alliance offers the best month-to-month and year-to-year consistency in carbide grain structure.

Ultra-Carb® 1

Cobalt Percentage: 6%
Grain Size (µm): ≤ 0.8
Hardness: 93.5 HRa
Fracture Toughness (K1c): 6.6
TRS (GPa): 3.8
Density (gm/cc): 14.90

ULTRA-Carb®

Ultra-Grain® 1

Cobalt Percentage: 10%
Grain Size (µm): ≤ 0.7
Hardness: 92.7 HRa
Fracture Toughness (K1c): 7.9
TRS (GPa): 4.1
Density (gm/cc): 14.30

(III) TOA Crains

(ULTRA-Grain)

SmoothGrind®

COMPONENT #2: The Grinding Process After selecting the best material available, Tool Alliance has perfected the manufacturing technology to optimize 100% of its physical properties. We call this process SmoothGrind®. Years in development, SmoothGrind is the result of a proprietary combination of material, abrasive, coolant, machine-tool, software, and grinding method technologies that produce

ULTRATOOL 200X

SmoothGrind® Competitor's

cutting tools with superior qualitative characteristics. Sharper and longer lasting cutting edges, enhanced work piece finishes, and much improved lubricity are just some of the benefits brought to you by the latest solid carbide rotary tooling advances from Tool Alliance. The two photos above display an Ultra-Tool end mill primary relief featuring SmoothGrind (left) versus a major competitor's product (right). To fully demonstrate the difference, the Ultra end mill is shown at double the magnification. Note the straight line of our end mill's primary relief in comparison to the jagged edge of the competing product. Keep in mind the competitive end mill is a very good product that has a large following, yet the difference is substantial.

SmoothContricity®

COMPONENT#3: The Tooling Process All the best physical ingredients are wasted unless they are all pulled together in a comprehensive system that maximizes their respective attributes. Tool Alliance calls this process SmoothContricity®. Our customer base represents the leading edge of machine tool utilization, and

SmoothContricity ensures that optimum results can be obtained in a variety of ways; minimized run-out (TIR), industry-leading tolerances on diameter & radius, and 100% Shrink Fit Ready (SFR) shanks. Combined, these attributes allow our consumers to reach full machining potential and position the cutting tool as a systematic contributor to process consistency and repeatability.

.0001 SmoothEdge atop
cylindrical margin atop primary relief.

COMPONENT #4: The Edge Preparation Process

Our cutting edges are literally too sharp for certain materials. For our carbide inserts and now increasingly for our solid carbide round tools, proper edge preparation can yield huge productivity improvements to "out of the box" tool application. Using a treatment we call SmoothEdge® and performed on machine tools developed in our own R&D lab, we've taken the mystery out of tool "break-in" and provided a consistency that can be counted on time and again. The processes range from a microblasting treatment using extremely fine aluminum oxide powder to a diamond-lapping compound to brushes. All are application-specific to sound and run smooth from the first cut and protect your tooling investment from unnecessary potential for chipping during your initial tooling paths. Big productivity gains can be achieved in certain applications as well due to improved chip formation and evacuation. Learn more about SmoothEdge on Page #55.

Our coating @ 2,000X (top). Everybody else's (bottom).

SmoothCoat®

COMPONENT #5: The Coating Process The challenge of finding a coating method to leverage 100% of the inherent assets of our carbide grade and grinding technologies was difficult. What we finally discovered was such a perfect fit and so logical for our product lines that we invested heavily into the process we now call SmoothCoat®. Much more than simply the standard arc-deposited PVD coating, SmoothCoat involves sputter multi-layering and a multi-step prep & post operation called Micro-Blasting. The advantages of this procedure include relieving of tensile stresses underneath the cutting edge, increased stability of the coating surface, and perhaps most importantly, elevating SmoothGrind even another notch by leveling and activating the cemented carbide substrate. The result is a smooth, shiny, tough, and durable surface that can withstand tomorrow's machining requirements and outlast competitive coatings. Additionally, we've made it a standard feature on thousands of our standard catalog items. Our coating services are performed within our own factories for quality & extremely quick turnaround times.

Coating Availability Order by adding the suffix TA, TN, AT, TC, A1, D1, or D2 to the EDP #.

UnCoated

Material Hardness

Premium Coatings available

Standard Coatings available at "Coated" List Price

materials up to 70HRc including high-temp exotics, nickel based alloys, die & hardened steels

ideal for dry milling & high speed machining

materials up to 50HRc including steel, stainless steel, & cast iron

areat choice for wide range of materials wet & dry applications

up to 30HRc

excellent lubricity & wear

aluminum, steel & stainless steel

> lower temp applications

aluminum, titanium, & non-ferrous

tremendous lubricity, reduced weld allows for dry milling

extreme hardness for wearability in graphites, plastics, silicon alloys & other abrasive materials

sharpest diamond edge

Multiple in-house coating systems offer superb quality and service.

extreme hardness for long life (10-50x) in graphite, carbon, composites & high silicon aluminum

> thickest diamond coating

ULTRATOOL Technical Data

The Edge Preparation Process

Our cutting edges are literally too sharp for certain materials. For our carbide inserts and now increasingly for our solid carbide round tools, proper edge preparation can yield huge productivity improvements to "out of the box" tool application. Using a process we call SmoothEdge® and performed on machine tools developed in our own R&D lab, we've taken the mystery out of tool "break-in" and provided a consistency that can be counted on time and again. All five types of SmoothEdge will yield different benefits dependent upon application. SmoothEdge will make your tools sound and run smooth from the first cut and protect your tooling investment from unnecessary potential for chipping during initial tool paths.

Combine Smooth Edge with our other value added features to design the ultimate cutting solution.

Primary SmoothCoat recommendations:

A1 for SE2

TA for SE4

AT for SE5

while on others it can be added as a same day post treatment for a small charge. Ask your Inside Sales representative about SmoothEdge today!

SmoothEdge 1

Our newest technology can achieve incredible productivity increases in specific

applications. Many of our new Series include SmoothEdge as a standard feature,

A microblasting treatment using extremely fine aluminum oxide powder to smooth the carbide surface while generating a very light edge preparation. This feature comes standard with any SmoothCoat® coating.

Uses: Highly recommended for most milling and drilling applications.

SmoothEdge 2

A lapping treatment to create extreme lubricity & smoothness with minimal edge prep on uncoated tools.

Uses: Highly recommended for milling and drilling of aluminum and other non-ferrous applications using UnCoated, A1, or TC coated tools.

SmoothEdge 3

Combines microblasting and lapping for a light hone with extreme lubricity.

Uses: Highly recommended for a wide range of general purpose machining applications using coated tools.

SmoothEdge 4

Adds a proprietary hone to the blasting and lapping cycles for a medium edge prep with excellent lubricity.

Uses: Highly recommended for milling and drilling applications involving general steels, stainless, and cast iron.

Doubles the honing and lapping cycle for maximum edge strength; a robust edge preparation combined with excellent lubricity characteristics.

Uses: Highly recommended for milling and drilling applications involving stainless, hightemp alloys, and exotics.

ULTRATOOL Technical Data

With so many variables present in the machining process, it is essential to optimize every possible factor to achieve world-class efficiency. Your choice of a genuine Ultra-Tool® Solid Carbide product is an excellent first step in the process. Ultra-Tool® Solid $Carbide\ products\ are\ high-performance\ tools\ that\ will\ perform\ bestin\ a\ machining\ environment\ characterized\ by\ rigid\ fixturing$ and minimal spindle runout. Attention to proper speed and feed will eliminate vibration, chatter, and overheating as well as extending tool life. Generally speaking, the peripheral speed of solid carbide tools will vary with the hardness of the material being cut. The harder the material, the slower the speed. High speed and insufficient feed will cause work surface glazing and poor tool life. Chipping of cutting edges is an indication of chatter which can be caused by too high of speed, too light of cut, or improper support of the tool or workpiece. Handling is also very important; sharpened cutting edges should never be allowed to come into contact with any hard object (or another tool) in a non-machining environment as they will chip easily. Keep your Ultra-Tool® products in their original protective packaging until ready for use.

The guidelines on the following pages are generalities designed to demonstrate the operating window within which you may experience the best results. The charts and information provided should prove valuable in longer tool life with greatly reduced operational costs. This information is for uncoated product: SmoothCoat products will have significantly higher speed and feed rates. For more information contact an Ultra-Tool® Factory Engineer, Sales Manager or consult our websites at ultra-tool.com and toolalliance.com. eMails can be sent to technical@toolalliance.com.

Ultra-Tool International, Inc. is constantly striving to improve its processes, specifications, and tolerances. As such, products are subject to change without prior notice.

WARNING: Grinding or other use of this tool may produce hazardous dust and fumes which may endanger health. Grinding or modification should be done by professionals only. To avoid adverse health effects, read the material safety data sheet for this product. Utilize adequate ventilation and appropriate protection. Cutting tools may shatter when broken; eye protection in vicinity of use is strongly advised. MSDS available at www.ultra-tool.com.

Application Tips for ULTRATOOL Solid Carbide Products

Trouble Shooting for Ultra-Tool® Carbide End Mills

Duchlous	Course	Calution
Problem	Cause	Solution
Chipping	Feed rate too high Up milling (conventional) Cutting edge too sharp Chattering Loose tool Workpiece rigidity Tool rigidity Low cutting speed Loose toolholder	Reduce feed rate Change to down milling (climb) Hone cutting edge or allow break-in Reduce RPM Remove, clean, and retighten Tighten workpiece holding method Shorten LOC, place shank further up holde Increase RPM Remove from spindle, clean and replace
Wear	High cutting speed Low feed rate Up milling (conventional) Hard material Poor chip evacuation Improper cutter helix Poor coolant	Reduce RPM Increase feed rate Change to down milling (climb) Use coated tool Reposition coolant lines, use air blasting Change to recommended helix angle Replace coolant or correct mixture
Breakage	Feed rate too high Depth of cut too large Poor tool rigidity Tool wear Poor chip evacuation	Reduce feed rate Reduce depth of cut Shorten LOC, place shank further up hold Replace/regrind sooner Reposition coolant lines, use air blasting
Chattering	Speed and feed too high Poor toolholder rigidity Poor spindle rigidity Workpiece rigidity Relief angle too high Depth of cut too large Poor tool rigidity	Reduce feed rate Replace with shorter/more rigid holder Use larger spindle or different machine too Tighten workpiece holding method Regrind with smaller relief angle Reduce depth of cut Shorten LOC, place shank further up holding
Short Life	Cutter/workpiece friction Hard material Poor material condition Improper cutter angle Poor coolant	Use coated tool Use coated tool Use coated tool, clean material surface Regrind with proper primary relief angle Replace coolant or correct mixture
Chip Packing	Feed rate too high Low cutting speed Insufficient chip room Insufficient coolant	Reduce feed rate or increase speed Increase RPM or reduce feed rate Use tool with less flutes, increase helix Increase volume of coolant
Poor Surface Finish	Feed rate too high Low cutting speed Tool wear Edge build up Depth of cut too large Chip welding	Reduce feed rate Increase RPM Replace or regrind tool Increase RPM, switch to higher helix tool Reduce depth of cut Increase volume of coolant
Burring or Workpiece Chipping	Tool wear Improper helix angle Feed rate too high Depth of cut too large	Replace or regrind tool Change to recommended helix angle Reduce feed rate Reduce depth of cut
Workpiece Inaccuracy	Loose/worn toolholder Poor toolholder rigidity Poor spindle rigidity Insufficient number of flutes Tool deflection	Repair or replace Replace with shorter/more rigid toolholder Use larger spindle or different machine too Use tool with higher flute quantity Shorten LOC, place shank further up holder

Trouble Shootin	for Ultra-T	Tool® Carbide Dr	ill
------------------------	-------------	------------------	-----

Problem	Cause	Solution (see key below)
Heavy Wear at Outer Edge	Insufficient coolant Incorrect speed & feed	• 5, 6 • 1, 2, 8
Chipping at Outer Cutting Edge	Loose tool, tool movement Workpiece movement Poor coolant conditions Incorrect speed & feed	• 8, 10, 11, 12, 14, 16, 17, 21 • 8, 12, 13, 21 • 5, 6 • 1, 2, 3, 4
Drill Point Chipping	Loose tool, tool movement Incorrect speed & feed Drill centering	• 10, 11, 12, 14 • 1, 2, 3, 4 • 8, 10, 11, 12, 21
Margin Wear	Drill margin rubbing wall Poor chip evacuation Poor coolant conditions Workpiece movement	• 20 (check drill for backtaper) • 5, 6, 8, 20 • 5, 6 • 8, 13, 21
Tool Breakage	Loose tool, tool movement Workpiece movement Wrong drill type Poor coolant conditions Incorrect speed & feed	• 8, 10, 11, 12, 14, 16, 17, 21 • 8, 12, 13, 21 • 9, 15, 16, 18, 19, 20 • 5, 6 • 1, 2, 3, 4
Poor Tool Life	Incorrect speed & feed Poor coolant conditions Wrong drill point	• 1, 2, 3, 4 • 5, 6 • 8, 21
Drill Walk	Incorrect speed & feed Tool wear Wrong drill point Material condition	• 1, 2 • 7, 8, 21 • 8, 10, 11, 21 • 11, 12, 15, 16, 17
Chip Welding	Poor coolant conditions Wrong drill type	• 5, 6 • 19, 20
Hole Size Inaccuracy	Incorrect speed & feed Poor coolant conditions Loose tool Wrong drill type	• 1, 2, 3, 4 • 5, 6 • 14 • 9, 18
Non-Cylindrical Hole	Loose tool, tool movement Workpiece movement Incorrect speed & feed Wrong drill type	• 8, 10, 11, 12, 14, 16, 17 • 13 • 1, 2 • 18, 21
Heavy Burr	Incorrect speed & feed Incorrect drill point	• 1, 2 • 8, 21
Blue Chips	Poor coolant conditions Tool wear	• 5, 6 • 7, 8
Long Chips	Poor point grind Incorrect speed & feed	• 8 • 1, 2
Solutions Key for Drills	2) Increase feed 9) Col 3) Increase RPM 10) Usi 4) Reduce feed 11) Spo 5) Increase coolant 12) Cle	prove rigidity/clamp 20) Use parabolic design

Trouble Shooting for Ultra-Tool® Carbide Reamers

Problem	Cause	Solution	Problem	Cause	Solution
Chatter	High cutting speed Feed rate too low Workpiece movement Toolholder rigidity Tool rigidity	Lower RPM or increase feed rate Increase feed rate Tighten workpiece rigidity Tighten toolholder or reduce float Use shorter tool, place further up holder	Poor Finish	Feed rate too low Insufficient stock removal Poor hole condition Poor coolant Insufficient coolant	Increase feed rate Use smaller diameter starter drill Work-hardened hole; change drilling typ Replace/correct coolant mixture Increase coolant volume
Tool Wear / Chipping	Incorrect feed rate Incorrect speed Poor hole condition Abrasive material Poor chip evacuation Poor coolant Insufficient coolant Workpiece alignment Excessive stock removal	Increase feed rate (typically) Reduce speed (typically) Work-hardened hole; change drilling type Use proper coolant, coated reamer Use/increase coolant, use helical reamer Replace coolant or correct mixture Increase coolant volume Use bushing, floating holder, lead chamfer Use larger diameter starter drill	Hole Tolerance	Workpiece alignment Incorrect tool size Material shrinkage Tool wear Toolholder runout	Use bushing, floating toolholder Check diameter of tool Adjust diameter for shrinkage; more coo Sharpen or replace tool Adjust or replace toolholder
	Incorrect feed rate Incorrect speed Tool wear Bottoming of hole	Increase feed rate (typically) Reduce speed (typically) Sharpen or replace reamer Adjust stop depth, check preset			

· Use bushing, floating toolholder

Use larger diameter starter drill

Coolant conditions
 Increase, replace, or correct coolant
 Insufficient stock removal
 Use smaller diameter starter drill

• Poor set up

• Excessive stock removal
